

BABY CATCOIN

WHITEPAPER

ABOUT BABY CATCOIN

Baby Catcoin is a next generation yield-generating contract on the Binance Smart Chain (BSC). All Baby Catcoin holders will receive BUSD rewards, the distribution is based on volume and current holding percentage. BUSD has been chosen as it is stable and not as volatile as other alt coins, this leads to every investor having a stable income on the side just by holding.

The token contract employs a static reward system and with the Baby Catcoin team performing manual buybacks as required.

10% of every transaction is split into three

-3% BUSD Reward is distributed to holders. The contract will automatically distribute every 60 minutes, however manual claiming can be completed if you wish to receive this in shorter time-frames

-5% Allocated in BNB to fund the project marketing wallet, include the buybacks and burn

-2% is used to fuel growth in the liquidity pool.

Sell tax will be 12% spread evenly across the above.

Max transaction will be 1% to limit dumps, with a max wallet of 2% to limit large whales.

The team will communicate any changes in the above tokenomics.

BEHIND THE SCENES

Every transaction processes a certain number of holder wallets, depending on the transaction size (bigger token transfers can process more, since the gas will still be proportionally less than the value of the tokens) The token is based on a Dividend-Paying Token Standard, which means all BUSD the contract gains will be split equally proportionally to the holders percentage.

When a holder wallet is processed, the contract checks how many withdraw-able dividends they have, and if it is above the minimum threshold for auto-claims, it will send the rewards to that wallet address. Holders may also choose to interact with the contract (buy one token) to increase the frequency of their pay-out.

This system is fully automated and uses minimal gas fees proportional to value transferred. The number of holders processed through each transaction is dynamic and based on transaction size. Holders will receive dividends from the queue based on their position in the array. It's a fair system, fully automated.

Within the chart, investors will see a sale accompanied by a secondary sale (when the swap amount for the contract is met), this is the contract selling the taxed tokens to BNB / BUSD and distributing to the LP, Marketing and Rewards.

The team will communicate any changes to the above, and if needed will limit the amount the contract sells to keep a healthy chart.
